                                                                                                                                                                                                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotypin and monitoring gene expression. The present sequence is a probe used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Haematopoietic cell proliferation disorder related oligonucleotide #982.
group has (C23)4 appended, where N87 is a branch point comprising a ring structure and C23 is shown in Fig IF PCTUSS99/01705"
                                                                                                                                                                               Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on

differentiating between hematropoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinuclectides within the target nucleic acid. ABZ0961 to ABZ11118 represent specifically claimed nucleotide sequences from the present invention. Oligonuclectides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative dissorder haematened from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        related sequences and their complements; and as primers for the amplification of haematopoletic cell profiferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients.
                                                                                                                                                                                                           Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-NOV-1994.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic
```

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESE) files AAQ75547-Q7598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                 cDNA and gene expression - by amplification of mRNA digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                   Sequence 19 BP; 0 A; 0 C; 2 G; 17 T; 0 other;

Human immunoglobulin transgene - with mu and gamma isotype switching Example 5; Column 33; 88pp; English segments

The invention relates to a heavy chain (human) immunoglobulin (Ig) transgene. The transgene comprises: (1) human VH gene segments; (ii) human D gene segments; and either (iv) a mu constant region comprising a mu switch sequence upstream from a mu coding segment; (v) a gamma constant region comprising a gamma switch acquence upstream from a human gamma coding segment; where (vi) the mu and gamma constant regions are closer than in wild type human Ig heavy chain loci; or (vii) a heavy chain enhancer; (viii) a mu constant region

comprising a mu switch sequence upstream from a mu coding segment; (ix) a gamma constant region comprising a gamma switch sequence upstream from a human gamma coding segment; and (x) at least one discontinuity of at least 2 kb between the mu and gamma gene segments as compared to a human germ-line heavy chain locus; or (xi) a human mu CH gene and at least two non-mu human CH genes and their associated isotype switching sequences; where (xii) the human mu and human gamma switch sequences are closer than in wild type human ig heavy chain loci. The transgenes allow non-human animals to produce heterotogous (human) ig's with varying specificities. The presence of mu and gamma switch segments allows isotype switching of the human heavy chain mini-locus from IgM (for maturation) to IgG.

Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP —

Example 13; Page 80; 168pp; English.

The invention relates to antisense oligonucleotides targeted to human PARP mucleic acid and inhibiting expression of human PARP. PARP PARP mucleic acid and inhibiting expression of human PARP. PARP PARP relations of partial partia

The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of funcleic acids. ABL88779 to ABL89321 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Collection of binding groups for determining or typing samples, especially clinical samples, has groups capable to identify essentially all members of the family of nucleic acids of relatively high

AAQ89234-Q89253 are PCR primers for fragments of hepatits C virus (HCV) or non-A non-B hepatits virus (NANBH) cDNA. These cDNAs code for amino acid sequences, which are antigens to structural and non-structural regions of the HCV virus. These antigens can be used in the diagnosis of NaNBH patients and the detection of HCV carriers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 individuals susceptibility to an autoimmune disease including individuals susceptibility to an autoimmune disease including insulin-dependant diabetes mellitus and coeliac disease (CD) by disturbing the HIA-DP genotype. CD is linked to the alleles DPB13, DPB1, DPB1, DPB3 or DEB4.2. Susceptibility to particular juvenile rheumatoid arthritis is indicated by the DPB2.1 allele. The process can also be used to provide forensic evidence.

                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAG54509-614 are primers and probes which were used in the method of the invention for determining the HLA-DP genotype of an individual. The method comprises amplifying a target region of the nucleic acid in the sample in question, under conditions suitable for carrying out PCR with a sequence specific primer. The target region contains a polymorphic region (variable segment) of an HLA DP gane. The amplified sequences are mixed with a panel of probes, where each probe is complementary to a varient sequence of a variable segment of an HLA DP gene, than the DP gene, under stringent binding conditions. The method is useful for determining an
                                                                                                                                                                                                                                                                                     Method for HLA - DP typing - comprises amplfication of target nucleic acid region and hybridisation with oligo-nucleotide probes

the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyzosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and theumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAK67275 to AAX75752 represent specific examples
                                                                                                                                                                                                                                                                                                                                                                                                                                          Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KOR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vaccular endothelial growth factor (VEGF). A patient preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                      Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.

RESULT 388

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (IL-1), kinase insert domain containing receptor (KRN) and/or foetal liver kinase 1 (flk-1) (e.g. tumour neceptor (KRN) and/or foetal liver kinase and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.

The sequences given in AAT80211-382 represent synthetic oligonucleotides which are complementary to a portion of the 5' untranslated region (UTR) of hepatitis C virus (ECV). These sequences may be used in a pharmaceutical composition for the control or prevention of HCV infection. They may be used to inhibit replication or expression of HCV or for detecting the presence of HCV in a sample. They may be used to inhibit therefore useful in the treatment of HCV infections such as chronic and are therefor useful in the treatment of HCV infections such as chronic and acute hepatitis and hepatocarcinoma. This oligo was used in a luciferase assay to determine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligo:nucleotide(s) complementary to HCV 5' untranslated region - used in the treatment and detection of HCV infection, esp. hepatitis
                                                                Complementary; 5' untranslated region; UTR; hepatitis C virus; HCV; inhibition; replication; expression; detection; chronic hepatitis; acute hepatitis; hepatocarcinoma; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  - nseq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This DNA sequence comprises the junction region between intron 4 (over 10 kb) and exon 5 of the human VEGF-C gene (see also AAT84276). Exon-intron junctions were determined (see AAT84303-14) for the entire VEGF-C gene, which comprises 7 exons and 6 exons. The VEGF-C gene on chromosome 4q23 codes for a novel ligand (AAW00932) of Flt4 receptor tyrosine kinase that can be used in a claimed method to modulate growth of endothelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                               The invention relates to a new method of treating an animal suffering from heavy metal poisoning, comprising administering a phosphorothioate oligonucleotide to the animal in an amount sufficient to chelate heavy metals to cause their excretion in the urine of the animal.

The method can be used to treat poisoning caused by cadmium, lead and/or mercury. The present sequence is one of two complementary phosphorothioate oligonucleotides (PS-ODNs) which were synthesised and tested for use in the method. Each PS-ODNs wise 18 bases in length and is associated with bases 7-24 downstream from the ATG translational start site of human metallothionein II mRNA. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                   Treatment for heavy metal poisoning - by chelating heavy metal ions with phosphoro:thioate oligo:nucleotide to cause excretion in urine
                                                                                                                                                                                                                                                                                                             the anti-MT antisense sequence, while the complementary sequence is

The present sequence represents an oligonucleotide of the specification. The specification describes a peptide which has affinity for thrombopoietic receptor. The peptide, which can be cyclic, can be used in the preparation of therapeutics useful for treating and preventing diseases caused by abnormality in haematogenic process of megakaryocytes.
                                                                                                                                                  The invention relates to a new method of treating an animal suffering from heavy metal poisoning, comprising administering a phosphorothioate oligonucleotide to the animal in a manount sufficient to chelate heavy metals to cause their excretion in the urine of the animal.

The method can be used to treat poisoning caused by cadmium, lead and/or mercury. The present sequence is one of two complementary phosphorothicate oligonucleotides (PS-ODNs) which were synthesised and tested for use in the method. Each PS-ODNs is 18 bases in length and is associated with bases 7-24 downstream from the ATG translational sequence is shown in AAQ67556, and the present sequence is its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant therapeutic peptide - useful for, e.g. treating diseases caused by abnormality in megakaryocyte haematogenic process
Treatment for heavy metal poisoning - by chelating heavy metal ions with phosphoro:thioate oligo:nucleotide to cause excretion in urine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Thrombopoietic receptor; therapeutic drug; treatment; prevention; disease; abnormality; haematogenic process; megakaryocyte; ss.

The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Barly-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ, A need exists for both a reliable diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease.
                                                                                                                                                                                                                                           PGI gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen; PSA; human; ss.

                                                           This sequence represents a PCR primer for a proto-oncogene/oncogene, and was used to test the method of the invention. The method is for increasing synthesis of nucleic acid (I) in a cell by exposing it to ultrasound, where (I) is: (a) an endogenous sequence (Ia) encoding a stress or repair protein; or (b) an introduced exogenous sequence (Ib).
                                                                                                                                                                                                                    The method is specifically used therapeutically: (1) to treat phenylketonuria (following introduction of (1b) for phenylalamine hydroxylase); (i) to increase expression of the p53 tumour suppressor; (iii) to increase expression of the p53 tumour suppressor; (iii) to increase production of 1b.2, particularly associated with natural killer cells; and (iv) for treating cancer by administering a sequence antisense to initiation factor 3 and/or tRNA synthase. More generally, (1b) may include one or more genes or fragments, or even complete chromosomes, for delivery (in vivo, in vitro or ex vivo) to animal or plant cells for treating a very wide range of conditions, e.g. acquired immune deficiency syndrome, autoimmune diseases, chronic viral infections, haemophilia, cystic fibrosis, and cancer. Ultrasonic treatment increases expression of (I) and increases uptake of (Ib),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

PCR primers AAX03120-21 were used to amplify reverse-transcribed RNA alsolated using the method of the invention. The specification describes a method for covalently joining a DNA strand to an RNA strand. The method comprises forming a topolsomerase-DNA intermediate by incubating a DNA cleavage substrate comprising a topolsomerase cleavage site with a topolsomerase specific for that site, where the topolsomerase-DNA intermediate has one or more 5' single-stranded tails, and adding to topolsomerase-DNA intermediate an acceptor RNA strand complementary to DNA strand to the RNA acceptor strand and dissociation of the covalently bound topolsomerase, thereby covalently joining the DNA strand to the RNA acceptor strand and dissociation of the transcripts. They are used particularly for isolating and cloning full-length gene sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ruman biallelic marker upstream amplification primer SEQ ID NO:6039.
                          to an RNA strand, used particularly for isolating and cloning full-length gene sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human genome, biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyphing; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;

. 0 display peptide; screening; biomolecule activity regulator; development; liver disorder; sclerosis; cancer; hepatitis C virus; effects from pharmaceutical agents acting on a disease as well as other The present invention describes a method for screening potential regulators of the activity of a biomolecule. The method involves screening the potential regulators by selecting from a library of recombinants which express peptides at their surface, one which expresses a peptide which interacts with the biomolecule and then screening potential regulators to identify those which inhibit the interaction of the biomolecule with the selected recombinant or the peptide expressed by it. The method is used for the identification of drug molecules for treatment and prevention of diseases, especially AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: They can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side Screening biomolecule activity regulators by their effect on a biomolecule-peptide interactions for identification of potential drug Gaps treatment. The present invention relates to antisense oligonucleotides (see AAAS5496-A55757) which are targeted to nucleic acids encoding a human tumour necrosis factor receptor-associated factor (TRAF). The antisense sequences comprise at least one modified internucleotide linkage, which is a phosphorothioate linkage. The oligonucleotides also include at least one modified sugar moiety such as a 2-0-methoxyethyl engar moiety. Sequences AAA55495 represent nucleotide sequences encoding human TRAF1-6. Included in the invention is a method for treating a human having a disease associated with the expression of TRAF comprising administering an antisense oligonucleotide. The reduction of jun kinase activation in cells comprises contacting the cells with an antisense oligonucleotide targeted to TRAF-2 or missense oligonucleotide targeted to TRAF-2 or TRAF-6. The antisense oligonucleotides have antiproliferative and antisense oligonucleotide targeted to TRAF-2 or TRAF-6. The antisense oligonucleotides have antiproliferative and anti-inflammatory activity and are useful for treating disorders associated with cell proliferation and inflammation. The antisense

```
The present sequence is one of a number of oligonucleotides designed to target different regions of the human NF-kappa-B p65 subunit, which is a member of the Rel/NF-kappa-B family of transcription factors.
Rel/NF-kappa-B proteins are involved in a diverse set of signaling pathways involving stress, apoptosis, cancer, growth, infection and inflammation. Antisense oligonucleotides are able to inhibit expression of the p65 subunit and may therefore be used in the treatment of disorders associated with NF-kappa-B p65 subunit expression. They may be used as a prophylaxis to prevent or delay infection, inflammation or tumour formation. Antisense compounds may also be used for research and
                                                                                                                                                                                                                                                     Human NF-kappa-B p65 subunit antisense oligodeoxynucleotide ISIS# 23738.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Autisense compounds which inhibit the expression of the human NF-kappa-B p65 subunit (p65) useful for treating diseases associated with p65 expression and as prophylaxis to prevent of delay infection,

Unknown bacterial 16S rRNA gene primer 0531R SEQ ID NO:7.

25-AUG-2000 (first entry)

The present invention describes a method for identifying a microorganism by comparing a composite sequence (I) of a ribosomal RNA gene region with FRAM region sequences of unknown microorganisms in a database and identifying the region in the database that matches with (I). (I) is generated by simultaneously obtaining nucleotide base sequence data from cevery copy of the KRNA gene region in the genome of the unknown microorganism. Also described is a method for identifying the species of microorganism by generating (I) and entering it into a first data register of a programmable computer, comparing the first data register with reference data registers that encode a unique composite rRNA ceptence corresponding to (I) and correlated with unique microorganism sequence corresponding first data register. The method is useful for identifying microorganisms which are useful in a variety of fields including human medicine, veterinary medicine, agriculture, food science and industrial microbiology. The microorganisms found in patients suffering from an infectious disease can also be identified.

Microorganism identification is also useful for monitoring food science also identified. The method is convenient and efficient as there is no need to isolate one or more individual 165 rRNA genes. AAA39021 to AAA39031 to examplification of the present invention. exemplification of the present invention 

Identifying an unknown microorganism by generating a composite sequence of its ribosomal RNA gene region and comparing with composite ribosomal RNA region sequences of distinct microorganisms in a database

diagnostics because they hybridise to mucleic acids encoding NP-kappa-B p65 subunit. The effect of antisense oligomucleotides on NP-kappa-B p65 subunit mRNA levels was measured using real-time quantitative PCR and Northern blot analysis. Antisense oligonucleotides were synthesised on an automated DNA synthesiser.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is an antisense oligonucleotide for the human G-alpha-i3 gene. The protein produced from this gene is a member of the G protein family, and more specifically of the Gi family. The Gi proteins are involved in hormonal inhibition of ademyly cyclase and the regulation of plasma membrane enzymes. In addition, G-alpha-i3 has been shown to have a role in the dopamine, thyrotropin-releasing hormone and somatostatin signal transduction pathways. The oligonucleotide may be used to modulate expression of the G-alpha-i3 gene and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Optionally 2'-methoxyethyl nucleotides providing bases 15..18 are also 2'-methoxyethyl nucleotides. All cytidine residues within this region are then 5-methylcytidine"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents an antisense oligonucleotide sequence targeted to a nucleotide sequence encoding human G-alpha-i2. G-alpha-i2 is a member of the Gi subfamily of G proteins, which is involved in hormonal inhibition of adenylyl cyclase and in the regulation of plasma membrane enzymes. The expression of G-alpha-i2 has been shown to be altered in some tumours. Mice lacking the G-alpha-i2 gene display growth retardation and develop adenocarcinoma of the colon and a form of lethal diffuse colitis similar to ulcerative colitis in humans. The antisense molecules are useful for inhibiting the expression of G-alpha-i2 in human cells or tissues, and for treating and preventing various disorders such as infection, inflammation and tumour formation. The antisense oligonucleotides are also useful for research and diagnostic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antisense oligonuclectide containing compounds, useful for inhibiting the expression of G-alpha-i2 in human cells and tissues and treating infection, inflammation and cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention describes phosphorothioate antisense oligonucleotides that specifically hybridise with, and inhibit the expression of, nucleic acids encoding human Ship-2 (also called SH2-containing phosphatidylinositol phosphatase-2). Also described is a method of inhibiting the expression of Ship-2 in human cells or tissues in vitro comprising contacting the cells with the phosphorothicate antisense oligonucleotides. The phosphorothicate antisense oligonucleotides can be used to treat animals (especially humans) suspected of having or being prone to a disease or condition associated with Ship-2 expression. The present sequence represents a phosphorothicate antisense oligonucleotide for human Ship-2, from

This sequence is an immunosuppressant inhibitor oligonucleotide, which is used in the invention. The invention relates to a composition which contains at least one inhibitor (less than 100 kD) of a substance (e.g. transforming growth factor TGF-beta, vascular endothelial growth factor VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors) that adversely affects the immune response. The composition also includes at least one stimulant that positively affects the immune response. This oligonucleotide is an example of an inhibitor that is used in the composition. The composition is used as an immunostimulant for the composition. The composition is used as an immunostimulant for the customent of neoplasms and infections, particularly hyperprofileration, leukaemia, (non-)Hodgkin's lymphoma; carcinoma (of oesophagus, bronchi, colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus, breast, ovary, cervix, endometrium, prostate or bladder), liver tumours, mast, of which are directed against TGFbeta or VEGF, are inhibitors of monocyte chemotactic protein-1 (MCP-1) and are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                              The invention provides a method for regulating formation and/or maintenance of adipocyte tissue that comprises contacting pre adipocyte or adipocyte cells with a hedgehog polypeptide or ptc therapeutic. The method is used for regulating the growth state of an adipocyte stem/progenitor cell, and treating or preventing disorders of, or surgical or commetter repair of, adipocyte tissues, e.g. for treating or preventing hyperplastic or neoplastic conditions affecting adipocyte issue, such as soft tissue tumors, especially adipose cell tumors, e.g. lipomas, fibrollipomas, lipoblastomas, lipomatosis, hibernomas, hemangiomas and/or therapeutic agents. Sequences Ali66784-793 represent primers used in quantitative RT-PCR of PPARgamma, aP2, gli, ptc and actin mRNAs, during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                      Method for regulating formation and/or maintenance of adipocyte tissue by contacting pre-adipocyte or adipocyte cells with a hedgehog polypeptide or ptc therapeutic

The present invention describes methods of clustering members of a sample, involving applying a hierarchical clustering algorithm to the sample members, determining the optimal number of clusters based on this and distributing the sample members into clusters using non-hierarchical clustering. The methods are useful in population based studies such as clinical trials, DNA fingerprinting appendic profile analyses. The present sequence was used to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NOV, olfactory; cytostatic; immunomodulator; vulnerary; anti-HIV; antiantalmatic; antiinflammatory; gastrointestinal; neuroprotective; osteopathic; gane therapy; odorant receptor; olfactory receptor; G-protein coupled receptor; GPCR; neuro-olfactory; trauma; PCR primer; neoplastic disorder; cancer; adenocarcinoma; lymphoma; prostate cancer; uterus cancer; immune response; AIDS; asthma; Crohn's disease; multiple sclerosis; Albright hereditary osteodystrophy; ss.

The present invention relates to novel human NOVX proteins and coding agequences, where X is any number from 1 to 18 (see AAH75716-AAH75733, and AAG64400 and AAG66322-AAG66338). NOVX are members of the charactery receptor (OR) family, which are G-protein coupled receptors (GPCRs). The NOVX proteins and coding sequences are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human diseases/disorders of the neuro-offactory system, e.g. those induced by trauma, surgery and/or neoplastic disorders. Furthermore, the coding sequences and proteins are useful in treating cancer e.g. adenocarcinoma, lymphoma, prostate cancer, ulterus cancer, inappropriate immune response, AIDS, asthma, Crohn's disease, multiple sclerosis or Albright hereditary ottodystrophy. The coding sequences are also useful in hereditary ottodystrophy. The coding sequences are also useful in easing the above present income. The present PCR primer was used in an example from the

Antisense compound capable of inhibiting the expression of human Smad7, useful for preventing or delaying infection, inflammation or tumor formation -
                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an antisense compound (I) of up to 30 nucleobases in length capable of inhibiting the expression of human Smad7. (I) has antiinflammatory and cytostatic, and is a modulator of smad7 expression. (I) can be useful for inhibiting the expression of human Smad7 in human cells or tissues, in vitro. (I) is commonly used as a research reagent and in diamostics for example, to elucidate the function of particular genes. (I) is also useful for distinguishing between functions of various members of a biological pathway and for research use. (I) is also utilised for diagnostics, therapeutics, prophylaxis and in kits. (I) is also useful prophylactically, e.g. to prophylaxis and in kits. (I) is also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. AMP26667

The present invention describes an isolated peptide (1) that binds to and inhibits vascular endothelial growth factor receptor 3 (VBGFR-3).

(1) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VBGFR-3 such as cancer, e.g. brain, lung, liver, spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, resticle, ovary, skin, head and neck, oeosphagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, copst-trauma, chronic hepatitis, haemangiomas and diabetee. The present sequence represents a primer used in the construction of a VBGFR-3 binding peptide library, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nG protein coupled receptor; communication; serpentine structure; seven transmembrane receptor; 7TM; mental disorder; diagnosis; genetic predisposition; brain; immune response; gene therapy; anxiety disorder; depression; bipolar disorder; schizophrenia; Huntington's disease; dyskinesia; manic depression; stroke; Parkinson's disease; Alzheimer's disease; disbates; inflammation; wound;

```
The invention describes synthetic oligonucleotides complementary to a portion of the 5' untranslated region of hepatitis C virus. The oligonucleotides may be used in methods for controlling, preventing, and treating hepatitis C virus infection, in antisense technology and gene therapy, and of detecting the presence of hepatitis C virus in a sample. Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded RNA virus which infects hepatocytes. HCV is the major cause of non-A, non-B, acute and chronic hepatitis, and has been associated with hepatocellular carcinoma. The invention describes methods and kits for inhibiting replication of HCV, inhibiting the expression of HCV nucleic acid and protein, and for treating HCV infections. This sequence represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting HCV replication and expression of HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single Primer Amplification; nested oligonucleotide extension reaction; hairpin; SPA; library; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic oligonucleotides complementary to a portion of the 5' untranslated region of hepatitis C virus (HCV), useful for diagnosing and treating HCV infections and hepatocellular carcinoma -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a method for amplifying a nucleic acid using Single Primer Amplification (SPA). The method comprises synthesising a Single Primer Amplification (SPA). The method comprises synthesising a structure with the nested oligomucleotide extension reaction. The method is useful for amplifying a nucleic acid, preferably for amplifying a prolypeptides encoded by the sequences to build a complex library of polypeptides encoded by the sequences. The engineered nucleic acid strand is useful for amplifying a nucleic acid strand by providing a nucleic acid with a predetermined sequence engineered nucleic acid strand sequence complementary to the predetermined sequence and a hairpin structure between them and contacting the engineered nucleic acid strand with a primer containing at least a portion of the predetermined sequence acomplementary nucleic acid strand. The method of the invention is useful complementary nucleic acid strand. The method of the invention is useful for producing large amounts of a target nucleic acid sequence and for amplifying simultaneously more than one different target nucleic acid sequence located on the same or different nucleic acid molecules. This polymucleotide sequence represents a PCR primer of the invention.
                                                                                                                                                                                         Amplifying nucleic acid by synthesizing template nucleic acid containing a predetermined sequence and hairpin structure and using the template for target amplification by Single Primer Amplification -

```
The present invention relates to a method of modulating amplification efficiency of a target sequence in primer-dependent polymerase-mediated DNA synthesis. The method comprises adding a template-mimic oligonuclectide (TMO) to a primer-dependent polymerase-mediated DNA synthesis reaction mixture containing primers, to block a primer for amplifying a target sequence in the mixture from hybridising to the target sequence. The method is useful for adjusting the efficiency of target template nucleic acid amplification by controlling the ratio of template-like oligonucleotides to amplification primers. The new method provides a convenient and efficient method for simultaneous detection of high and low-abundant genes in multiplex RT-PCR, and is more potent and easier to control than the Competimer method. The present sequence represents a PCR primer used in a real-time PCR assay in the example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; immunosuppressive; antirheumatic; antiarthritic; antiulcer; antianaemic; antipsoriatic; B7-related polypeptide; BSL1; BSL2; BSL3; autoimmune disease; rheumatoid arthritis; multiple sclerosis; Hashimoto's thyroiditis; Graves' disease; Crohn's disease; psoriasis; ulcerative colitis; permicious anaemia; bone marrow transplantation; graft versus host disease; organ transplantation; BSR.

The invention relates to novel nucleic acids encoding B7-related polypeptides. The B7-related polypeptides include the BSL1, BSL2, or BSL3 polypeptides. The mucleic acid, polypeptide, and and antibodies are useful for treating autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, Hashimoto's thyroiditis, graves' disease, Crohn's disease, ulcerative collitis, pernicious anaemia and psoriasis. They may also be used to treat tissue, bone marrow, and organ transplantation, and graft versus host disease. ABK24010-ABK24093 regresent B7-related proteins, BSL1, BSL2 and BSL3 coding sequences and

Determining the racing potential of a horse comprises measuring whether grandpaternal or grandmaternal DNA from the selected grandmother DNA is over-represented in the genome of the horse

Example 2; Page 25; 49pp; English

The invention relates to a novel method for determining racing potential of a horse. The method comprises measuring: whether grandpaternal DNA is over-represented in the genome of the horse; or in the case where one of the grandmothers was selected for breeding on the basis of racing performance, whether grandmaternal DNA from the selected grandmother is over-represented in the genome of the horse which indicates that the horse has good racing potential. The method of the invention is useful for determining the racing potential of a horse or for obtaining a progeny horse with good racing potential of a horse or for obtaining a progeny horse with good racing potential. This polynucleotide sequence represents a PCR primer used in the detection method of over-representation of DNA from male grandparents of the invention.

PCR primer for human early mitotic inhibitor 1 (Emil) cDNA.

```
The invention comprises the amino acid and coding sequence of B7-related (BSL2) fusion proteins. The B7-related fusion proteins of the invention are useful for modulating the activation of immune or inflammatory response cells (e.g. T cells). The B7-related fusion proteins are useful for treating or preventing: transplantation rejection, graft versus host disease, asthma; chronic obstructive pulmonary disease, cancers; viral infections (e.g. HIV, herpes or encephalitis); and autoimmune disease (e.g. rheumatoid arthritis, multiple sclerosis or psoriasis). The present by sequence represents a PCR primer that was used in an example of the

pCR primers ABV77248-49 were used to amplify CDNA encoding human early mitotic inhibitor 1 (Emil) polypeptide. Emil polypeptides are used in the method of the invention to inhibit the anaphase-promoting complex (APC) in a proliferating cell. To this end, the Emil polypeptide is provided to a cell undergoing mitosis. The method is used to inhibit APC in a proliferating cell. Emil is used to screen for biologically active agents that modulate Emil function or that mimic Emil activity, and the agents are used for enhancing APC in a proliferating cell. The Emil is useful for modulating the cycling of cells, e.g. for treating hyperproliferative conditions, in diseases involving tissues where there is a high rate of cell turnover, and in modulating ocyte activation.

Inhibiting the anaphase-promoting complex in a proliferating cell, useful for treating hyperproliferative conditions, comprises providing an early mitotic inhibitor 1 polypeptide to a cell undergoing mitosis

The present invention describes a new isolated nucleic acid sequence (I) comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also known as prolyloligopeptidase). (I) has antiinflammatory, antiasthmatic, antiasthmatic, antiasthmatic, antistendatic, antiasthmatic, antiporatic, and antitheumatic activities, and can be used in vaccines and gene therapy. A composition comprising (I) can be used for the manufacture of a medicament for regulating DPP10 expression or for preventing or treating inflammatory disease e.g., inflammatory bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can also be used in an assay for detecting or measuring DPP10 in a sample. A host cell comprising (I) can be used for producing recombinant DPP10 gene products, or in drug screening systems to identify agents for diagnosis or treatment of individuals having or susceptible to inflammatory disease. Human DPP10 is located on chromosome 2, more specifically chromosome 2414. ABQ84524 to ABQ84612 and ABPS5569 to ABDS5629 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid sequence comprising DPP10 mRNA, useful for the manufacture of a medicament for regulating DPP10 protein expression or for preventing or treating inflammatory disease e.g., inflammatory bowel disease
                                                                                                                                                                                                                                                                                                                                                               Lench N;

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG minucleotides within the target nucleic acid. ABZ09661 to ABZ1018 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention on be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute sphotosytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPS) of haematopoietic cell proliferation disorder related only haematopoietic cell proliferation disorder related on DNA sequences and their complements; and as primers for the manaloguesic proliferation of sequences from the present invention can also be used for detecting a predisposition to, differentiation between subject haematopoietic cell proliferative disorders. The present method enables hamply specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients. Haematopoietic cell proliferation disorder related oligonucleotide #586. Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG Berlin K, Braun A, Distler J, Guetig D, Howe A, Mueller J; Olek A, Piepenbrock C, Adorjan P, Grabs G, Lesche R, Leu E; Lewin A, Lipscher E, Maier S, Model F, Mueller V, Otto T; Pelet C, Schwope I, Ziebarth H; . 1.0%; Score 13.2; DB 1; Length 18; 33.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute solventianing the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the maplification of haematopoietic cell proliferation disorder related mapping a predisposition to, differentiation between and a primers for the amplification of haematopoietic cell proliferation disorder related between the present invention can be used for detecting a predisposition to, differentiation between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Haematopoietic cell proliferation disorder related oligonucleotide #1159.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopodetic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients.
                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes a mechoa for detecting and present invention describes a methoa for detecting and associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target mucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZOSSE1 to ABZOSSE1 to ABZILLIS represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells, for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide collymophymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements, and as primers for the calated sequences and their complements, and as primers for the calated sequences. The nucleotide sequences from the present invention can subob a used for detecting a pracisopsition to, differentiation between suboliterative disorders. The present method enables allowing for improved and informed treatment of patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Haematopoietic cell proliferation disorder related oligonucleotide #1160.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting and differentiating between hematopoietic cell proliferativ
disorders, comprises contacting a target nucleic acid with a reagent
that distinguishes between methylated and non-methylated CpG

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated cipG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related manning the nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prepagnosis, treatment and/or monitoring of haematopoietic cell proliferation ethod enables a highly specific classification of haematopoietic cell proliferative a highly specific classification of haematopoietic cell proliferative a highly specific classification of haematopoietic cell proliferative ö Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG disorders allowing for improved and informed treatment of patients. Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides

Claim 15; Page 76; 117pp; English.

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a bological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid ABZ09861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute myelogenous leukaemia; as probes for determining the cyrosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder cangilification of haematopoietic cell proliferation disorder related mys sequences and their complements; and as primers for the mys sequences and their complements from the present invention cangils be used for detecting a predisposition to, differentiation between to subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative cell proliferative of angulations.

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least I gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least I reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention and be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells, for differentiating between acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related amplification of haematopoietic cell proliferation disorder related amplication disorder related amplication disorder related amplication disorde
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferation disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients.
Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABE99899, ABH00010-ABH99989 and ABI00010-ABE9989, ABF00010-ABH99989 and ABI00010-ABH99989 and specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format from WIPO at fit. wipo.int/pub/published\_pot\_sequences.

                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE09989, ABF00010-ABE09989 and ABE00010-ABE09989 and shalloudous ABE180273 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABH00010-ABH99989 and ABL00110-ABC9989, abeceting cell type differentiation. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                 SNP; single nuclectide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 88; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. ABC00010-ABE09989, ABF00010-ABF99989, ABH00010-ABH99989 and ABE10010-ABE182073 represent the oligoners described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from NIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SND; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                  ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status

triphosphates used as antiviral agents and synthons

Claim 179; Page 156; 259pp; English.

Claim 1; SEQ ID 218074; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a renge of diseases including immune system, gastrointestinal, respiratory, oligomers are also used for detecting cell type differentiation.

ABC00010-ABE09999, ABF00010-ABF99999, ABH00010-ABH99999 and ABC00010-ABE18073 represent the oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed ffp.wipo.int/pub/published\_pct\_sequences.

A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (BBD), comprising a random sequence, and a catalytic domain (CD); and (B) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine

c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV99922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relament of mRNA at the nucleotide base position indicated in the DB line.

The rela gene product is a subunit of the transcriptional regulator NF-kappab and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and spring structures and that contain potential hammerhead analysis. Ribozyme cleavage sites were identified by computer analysis. Ribozyme directed against these mRNA sequences were callysis and springed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis to and asthrma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotide array; genotyping; single base extension reaction; SBE; PCR primer; polymorphic locus; single nucleotide polymorphism; ss.

```

BP.

```
phospholipid transfer protein (PLTP) gene, involving determining the identity of the nucleotide present at one or more of the 25 polymorphic sites within the gene. This can be used to aid drug development for the treatment of diseases associated with different haplotypes of the PLTP gene, possibly including atherosclerosis. The present sequence is an allele-specific primer used for detecting polymorphisms in the PLTP gene
                                                                                                                                                                                                                                                            1.0%; Score 13; DB 1; Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·.
                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide tags fixed to a solid substrate. The oligonucleotide tarray is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SEB) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to
                                                                                                                                                                                                          Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, piryriasis, ruba, pilaris, serborthoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide. (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein (IGFBP)-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide so of the present invention (see AAF45151 and AAF4513-1 The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition of warts, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor 1 receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic;

The present invention relates to methods and oligonuclectides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonuclectide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonuclectide binds in a parallel and antiparallel orientation, respectively. to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression is regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helix sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenicity and conviruence of the oligonucleotides can be selected to sequences required by pathogenicity. Alternatively, the oligonucleotide can be chosen to cauget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be chosen to carget a unique sequence of the oligonucleotide can be carged to carget a unique sequence of the carget and carget a unique sequence of the carget and carget a unique sequence of the carget and carget and carge
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pigonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonuclectide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Triple-helix formation; purine-rich target sequence; double-helix DNA; gene expression; regulatory sequence; pathogenic double-stranded DNA; pathogenic bacteria; virus; replication; virulence; cancer; oncogene suppression; cancerous cell; cytostatic; antimicrobial; ss.

A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression -

Example 7; Fig 24A; 108pp; English.

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specific sequences within genomic DNA including specific specific and specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virule or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the virulence, reducing their pathogenicity. Alternatively, the pligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer specific

Novel genetic variants of Lipase, Hormone-Sensitive isogenes, useful for improving efficiency and reliability in drug development for treating diseases associated with LIPE activity, e.g. obesity and male sterility

Claim 15; Page 14; 142pp; English.

The present invention relates to a new polynucleotide comprising a nucleotide sequence which comprises lipase, hormone sensitive (LIPE) isogenes. The invention is useful in screening for drugs targeting LIPE isogenes that are useful for treating obssity and male sterility. The isogenes that are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs reliability of several steps in the discovery and development of drugs of its useful in studying the expression and function of LIPE, and in expressing LIPE protein for use in screening for candidate drugs to treat diseases related to LIPE activity. It is also useful in studying the effect of the variation on the biological activity of LIPE as well as on the binding affinity of candidate drugs targeting LIPE for the treatment of consists and male sterility. The invention is useful for studying the expression of LIPE isogenes in vivo, for in vivo screening and testing of the capteut against LIPE protein, and for testing the efficacy of the respective against LIPE protein, and for testing the efficacy of the appendic agents and compounds for treating obesity and male sterility in a biological system. The present nucleic acid sequence represents one the biology probes that were used in the invention to detect polymorphisms in the human LIPE gene.

The invention describes an isolated polynucleotide, which comprises genes and haplotypes of the small inducible cytokine subfamily A (Cys-Cys), member 20 (SCYA20) gene. The polynucleotide comprises polynorphic sites referred to as PS1-9 to designate the order in which they are located in the gene. The polymorphisms and haplotypes of SCYA20 gene are useful for validating whether SCYA20 is a suitable target for drugs to treat peoriasis and disorders associated with its abnormal expression or function, soreening for such drugs and reducing bias in clinical trials of such drugs. Haplotype information would be useful in improving the circlency and output of several steps in the drug discovery and development process, including target validation, identifying lead compounds, early phase clinical trials. The methods are useful in screening for compounds targeting SCYA20 to treat a specific condition criseases predicted to be associated with SCYA20 activity, e.g. psoriaeis. This sequence represents an allele specific oligonucleotide (ASO) probe used to identify polymorphisms in the SCYA20 gene.

```
The present invention describes an isolated human period (Drosophila)
homologue 1, (PER1) polynucleotide (I) comprising a sequence which is a
polymorphic variant for a reference sequence (RAELSTOT) for the PER1 gene
to till fragment, or a polymorphic variant of a reference sequence
(ABESZOTS) for a PER1 CDNA or its fragment. The present invention also
describes methods for genotyping and haplotyping the PER1 gene of an
individual. (I) is useful in studying the expression and function of
PER1, and in expressing PER1 protein for use in screening for candidate
crherapeutic purposes. A recombinant non-human organism transformed or
transfected with (I) can be used for studying expression of the PER1
isogenes in vivo, for in vivo screening and testing of drugs targeted
against PER1 protein, and for testing the efficacy of therapeutic agents
and compounds for disorders associated with circadian rhythm regulation.
The present sequence represents an allele specific oligonucleotide probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated human period Drosophila homolog 1 polynucleotide, useful for therapeutic purposes, for studying the expression and function of the polynucleotide, and for expressing the homolog -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to single nucleotide polymorphisms in the gene encoding human alcohol dehydrogenase 7 (class IV), mu or sigma polypeptide (ADH7). A method for haplotyping the ADH7 gene in an individual comprises identifying the nucleotide at one or more individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ADH7 haplotypes given in the specification or whether both copies are defined by a haplotype pairs can be useful in genotyphing, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair of the ADH7 gene can be identified by comparing the frequency of the haplotype pair in a reference population, where a higher haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair. ADH7 and its corresponding DNA are used for studying the expression and function of ADH7, and in screening for candidate drugs to treat diseases related to ADH7 activity, such as concerned pair allele-specific oligonucleotide probes used for detecting ADH7 gene
                                                                                                                                                    Human; alcohol dehydrogenase 7 class IV; ADH7; probe; ss; haplotype pair; haplotyping; cytostatic; antiparkinsonian; sigma polypeptide; cancer; single nucleotide polymorphism; genotyping; gene therapy; drug screening; mu polypeptide; Parkinson's disease; chromosome 4q23-q24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New genetic variants of the alcohol dehydrogenase 7 (class IV) mu or sigma polypeptide (ADH7) gene having polymorphisms, useful for treating disorders affected by ADH7 isogene expression or function, e.g. cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sausker EA;
                                                                                                                   Human ADH7 gene allele-specific oligonucleotide probe #12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1.0%; Score 13; DB 1; Length 15; 86.7%; Pred. They are used in the detection and separation of nucleic acid molecules and as probes, primers, linkers, adapters and antisense agente on solid supports. Modifications enhance their use as capture and detection probes e.g. by the incorporation of biotin, digoxigenen, radioisotopes, fluorescent labels such as 1 knorescent and reporter molecules such as alkaline phosphatase. They are also used for enhancing or inhibiting the activity of an enzyme or cellular activity. The compounds are stable to nucleases and proteases, have high affinity, binding specificity and solubility. The polyamide backbone of PNAs is resistant to both nucleases and proteases. PNAs bind mucleic acid molecules with greater affinity than DNA or RNA concentration. The compounds are relatively simple to synthesize and are used in a wide variety of applications. This sequence

```
The invention relates to single nucleotide polymorphisms in the gene encoding the human B-factor properdin protein (BF). A method for haplotyping the BF gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the BF haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotypes. An association between a trait and a haplotype or haplotype or haplotype pair of the BF gene can be identified by comparing the frequency of the haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair in a reference population indicates the trait is associated with the haplotype or haplotype pair. Br and its corresponding DNA are used for studying the expression and function of BF, for use in screening for candidate drugs to treat diseases related to BF activity, such as diabetes and systemic lupus erythematosus. Sequences ABK63994-ABK64049 or represent allele-specific sequencing primers used to detect human BF gene
                                                                                                                                                                                                                                                                                                 New genetic variants having polymorphisms in the B-Factor, Properdin (BF) gene, useful for studying the function of BF, and for treating disorders affected by expression or function of the BF isogene -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human growth hormone releasing hormone receptor (GHRHR) gene located on chromosome 7pl4, and methods for haplotyping and/or genotyping the GHRHR gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the GHRHR gene polymorphisms. The polymorphisms are useful for the treatment of diseases associated with GHRHR activity, such as isolated growth hormone deficiency (IGHD) and pituitary adenomas.

AASI9622-AASI9647 represent ASO primers for detecting human GHRHR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                   Genotyping human Growth hormone releasing hormone receptor gene of individual for determining haplotype of individual by determining identity of nucleotide pair at specific polymorphic sites for two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Colony stimulating factor 1 receptor; CSF1R; polymorphic variant; cytostatic; gene therapy; malignant histiocytosia; isogene; myeloid malignancy; inflammatory disorder; transgenic animal; haplotype; genotype; human; allele specific oligonucleotide; ASO;

Novel polymorphic variants of colony stimulating factor 1 receptor useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases e.g. inflammatory disorders

15; 164pp; English. Page

The invention describes a novel isolated polymucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimularing factor I receptor (CSFIR) gane, found on The colony stimularing factor I receptor (CSFIR) gane, found on The polypeptide are useful for improving the discovery and development of anilarmmatory discovery and the haplotypes can be used to validate CSFIR activity, e.g., and inflammatory discorders and the haplotypes can be used to validate CSFIR a candidate target for treating a specific condition or disease predicted to be associated with CSFIR and in the validate CSFIR species of an individual can also be used in studying the expression and therapeutic treatments. (I) is useful in studying the expression and function of CSFIR, protein for use in screening for candidate drugs to treat diseases related to CSFIR argeting CSFIR, Antibodies are useful in a variety of diagnostic and prognostic formats and therapeutic useful in a variety of diagnostic and prognostic formats and therapeutic contents in vivo screening and testing of drugs trargeted against CSFIR protein, and for testing the efficacy of therapeutic agents and compounds. Allele specific oligonucleotides (ASO) are useful as probes and primers, and for assaying a polymorphism in the target region. Without requiring any a priori knowledge of the phenotypic effect of any particular CSFIR or are useful as probes and primers, and for assaying a polymorphism in the efficacy in clinical trials. This sequence is an allele specific oligonucleotide probe used for detecting CSFIR gene polymorphisms, coligonucleotide probe used for detecting CSFIR gene polymorphisms, coligo

New isolated polynucleotide which is polymorphic variant of phospholipid transfer protein (PLTP) gene, having any one of polymorphic sites PSI-PS25, for studying function of PLTP, and expressing PLTP protein

Claim 15; Page 72; 99pp; English.

The invention relates to single nucleotide polymorphisms in the gene encoding the human phospholipid transfer protein (PLTP). A method for haplotyping the PLTP gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the PLTP haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotypies. An association between a crait and a haplotype or haplotype pair of the haplotype or haplotype pair of the haplotype or haplotype pair of the haplotype or haplotype or haplotype pair of the haplotype or haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair. In a reference population, where a higher haplotype or haplotype or haplotype pair in a reference population of PLTP, for use in screening frequency in the trait population indicates the trait is associated with the haplotype or haplotype pair. PLTP and its corresponding DNA are used for studying the expression and function of PLTP, for use in screening for studying the effect of variation on the sequences are also useful for studying the effect of variation on the candidate drugs targeting PLTP for treating atherosclerosis. Sequences AASS4691 represent allele-specific oligonucleotide probes, and purpose. polymorphisms. NAME OF THE PART O

```
The present invention describes a method for predicting nucleic acid hybridisation thermodynamics (HT) comprising providing a database of thermodynamic parameters (FT), receiving hybridisation information which represents a sequence, receiving correction data, and a first set of data which represents hybridisation conditions, and calcularing HT correction data and the first set of data. Also described are: (1) a computer-readable storage medium having stored in it, a database of TP and a computer program which executes the above method; and (2) a system computer program which executes the above method; and (2) a system and a computer program which executes the above method; and (2) a system computer program which computers at least one for predicting nucleic acid HT, comprising a database of TP, units for receiving hybridisation information which represents at least one sequence and for receiving correction data, receiving a first set of data which represents hybridisation conditions and unit for calculating HT. The method and system are useful to optimise and predict probe-target hybridisation. The method and system takes into account of single strand thermodynamics not taken into account by prior art methods. ABL42498 to ABL42626 represent oligonucleotide sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0,
            Predicting nucleic acid hybridization thermodynamics based on hybridization information, thermodynamic parameter, correction data and first set of data which represents hybridization conditions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ·

The 3' end of this oligonucleotide carries 1,3-propanediol. The oligo is one of four oligonucleotides which were designed to specifically bind and cross-link to the duplex target sequence AAQ20004. Oligo #2 has the covalent cross-linking group, i.e. N4N4-ethanocytosine, at its 3' end. An assay for crosslinked triple helix showed considerable reaction with Oligo #2 and with Oligo #1 (see AAQ20005) which has the crosslinking group at the 5' end. The most complete reaction was seen with Oligo #3 (see AAQ2007) having N4N4-ethanocytosine at both the 5' and 3' termini, A control oligo with no cross-linking group showed no reaction. The half-life of the cross-linking reaction for Oligo #2 was ca. 1 hr (1 microM);
                                                                                                                                                        Oligo #1 showed a rate four times slower. See also AAQ20008

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAQ33414-17 are probes which were used to recognise polymorphic sites within the full length acid sphingomyelines (ASM) gene. This was done to determine the population frequency of the different alleles. The template DNA was genomic DNA from normal Caucasian individuals. Certain mutations in the ASM gene lie. R496L, deltaR608 and L302 have been found to correlate with Neimann-Pick disease (NPD). See also AAQ33390-423.

The DNA to be detected is sequence using like an unit of them these probes which are pref. labeled using 32-P gamma-ATP are used to detect the mutant sequences. The primers and probes given in AAQ92098-219 are used in the method of the invention for detecting mammalian target DNA in sputum samples. Analysis of the target DNA is used to diagnose benign or malignant neoplasms of the lung. It is also useful for screening people at high risk or for monitoring progress of treatment of lung neoplasms. The method is based on the discovery that mutant target DNA associated with lung cancer is present at detectable levels in sputum. Cells shed into sputum from head and neck cancers may also be detected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
The present sequence is a probe for a human acid sphingomyelinase (ASM) genomic DNA codon 506 mutation.

C Diagnosing Type A or B Niemann-Plck disease (NPD), or identifying a person as having the potential to genetically transmit Type A or B NPD, comprises detecting a recessive mutation in the ASM gene, which results in an alteration of at least 1 amino acid in the ASM amino acid sequence. The method is especially useful for prenatal diagnosis in Ashkenazi Jewish populations. The mutation is a Arg496Leu, deltaArg608, Leu302Pro or fsp330, where fsp330 is a crame shift mutation comprising a cytoshen deletion in ASM codon containing portions of the ASM gene by PCR using primers containing portions of the ASM gene by PCR using primers and sequencing the amplified DNA or subjecting it to a mid sequence, and sequence encoding it can also be used in the apprencing or the CDNA sequence encoding it can also be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosing Type A or B Niemann-Pick disease - by detecting recessive mutation in acid sphingomyelinase gene
                                                                            for acid sphingomyelinase genomic DNA codon 506 mutation.

The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090 represent specifically claimed target sequence from human EGF-R. AAV98044 haty98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMS are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell. The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78752 and ABB98519 to ABB98520). HTPL broates in (HTPL, see ABV78759 to ABV78752 and ABB98519 to ABB98520). HTPL two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is contacted to the shared structure of a medicament, and the HTPL gene was mapped to human chromosome 1012.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of the HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, sheletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligomucleotide was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 17 BP; 3 A; 7 C; 6 G; 1 T; 0 other;

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL brotein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL to be two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-8 (S for short) compared to HTPL-10 (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares atructural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the HTPL. Such disorders include disorders expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and forcal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonuclectide was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 17 BP; 3 A; 6 C; 7 G; 1 T; 0 other;

This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of
                                                                                                                                                                                                   Cytokine-specific probes were used to screen products obtd. by RT-PCR amplification (see AATOS878-93) of cellular RNA from human peripheral blood monounclear cells stimulated with an anti-CD3 MAD. Probes were human IL-2 exon 2-specific (AATOS894), human IL-2 exon 3-specific (AATOS895), human IL-5 exon 1/exon 3 junction-specific (AATOS895), human IL-5 exon 1/exon 3 junction-specific (AATOS897) and human GM-CSF exon 1/exon 3 junction-specific (AATOS899) and IL-2 (AATOS899). Novel splice variants of IL-4 (AATOS899) and IL-2 (AATOS900) lacking exon 2 were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  G-alpha-13; human; inhibitor; cancer; antisense compound; therapy; ss.
                                                                            New human interleukin alternative splice variants - expressed by exon(s) 1, 3 and 4 of \rm IL-4 or \rm IL-2, used for regulating the activity of corresp. interleukin(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense compound inhibiting expression of human G-alpha-13

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the use of phytanic acid or its derivatives for the treatment or prevention of diabetes mellitus. The invention also relates to a method for treating or preventing non-insulin dependent diabetes mellitus (NIDDM) or other conditions associated with impaired glucose tolerance such as obesity using phytanic acid, their is derivatives or their precursors are useful as pharmaceutical compounds or supplements to foods or feeds for the treatment or prevention of type II or NIDDM, hyperlapidaemia, hypercholesterolaemia, hyperinsulinemia, syndrome X, hypertension, hypertrighyceridaemia, impaired glucose tolerance and related obesity. They are also useful in insulin therapy in combination with known active compounds. The present sequence is low-density continued in hypercesset remascription PCR (RT-PCR) primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                                                                                                                            New composition comprising phytanic acid or its derivatives, useful for treating or preventing non-insulin dependent diabetes mellitus, impaired glucose tolerance and related obesity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                              Human biallelic marker downstream amplification primer SEQ ID NO:8784.
                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N.B. The SEQ ID NOs 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.
                                                                                                                                                                                                                                                                                                                           Human genome; biallelic marker; high density diseguilibrium map; genomic map; haplotype; polymorphic base; genotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; NPP; PCR primer; amplification; single nucleotide polymorphism; NPP; PCR primer;

The present sequence is that of fluorescent target oligonucleotide
T2, which was used to demonstrate an electron hybridisation method
cof the invention. Mn203 stabilised n-type silicon photoelectrodes
coated with a streptavidin-agarose permeation layer were shown to
cligonucleotides by electron hybridisation layer were shown to
cligonucleotides by electron hybridisation. In this process, a
set of unlabelled oligonucleotides (capture strands) are first
targeted to specific locations and anchored. A second set of
fluorescent labeled oligonucleotides (target strands) is then
targeted to the same locations and anchored. A second set of
capture strands. In the example provided, 2 sets of biotinylated
capture probes. Cl (see AAH26908) and C2 (see AAH26909), were
capture probes. Cl (see AAH26908) and C2 (see AAH26909), were
successively transported and anchored to 4 different locations on a
streptavidin-agarose and Mn203 coated amorphous silicon substrate.
Ta (present sequence), were then transported to a location with
complementary capture probes and a location with non-complementary
complementary capture probes and a location of the nation between signal and non-specific background was better
fluorescence signals at the 2 locations with matching sequences.
The ratio between signal and non-specific background was better
capture probes for photoelectrophoretic transport and hybridisation of
manufacture of micro electrophoretic transport and hybridisation of
manufacture of micro electrophoretic transport and hybridisation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Device for photoelectric transport of charged materials in liquid environment for micro- and opto- electronic devices, has a substrate generating light induced current, conductor, permeation layer and light source to illuminate elbetrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oligonucleotides. The techniques of the invention have wide use ir manufacture of micro electronic and opto electronic devices. Self-assembly fabrication techniques based on DNA polymers enables micron, sub-micron or nanoscale devices to be fabricated.
                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "fluorescent dye with 493 nm absorption and 503 nm emission"
                                                                                                                                                                        Fluorescent oligonucleotide target for electronic hybridisation.

The composition further provides a reactive portion capable of catalysing, alkylating, or otherwise effecting the cleavage of RNA, especially of its phosphodiester bonds. The compositions are useful for modulating the activity of RNA and DNA. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New heterocycle derivatives, useful for modulating the activity of RNA

The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on ehromosomes 3, 10 and 19. The markers are useful for genotyping or estimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. a disease involving drug responses, obesity or disorders related to obesity, such as hyperuricaemia, digestive pathology, hepatic function disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiac insufficiency. The markers are useful for detecting a statistical correlation between a biallelic marker allele and a phenotype and/or between a biallelic marker haplotype and a phenotype and/or between a biallelic marker haplotype and a phenotype and/or between a biallelic marker haplotype and a phenotype sente represents a PCR primer used to amplify a human obesity-associated biallelic marker.
                                                                                                                                                                                                                                           Human; obesity associated-biallelic marker; chromosome 10; obesity; ss; delug response; hyperuticaemia; digestive pathology; hypertension; cancer; hepatic function disorder; cardiovascular disease; hyperlipidaemia; PCR; insulin disorder; atheromatous disease; cardiac insufficiency; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19, useful, for e.g. detecting statistical correlations between marker allele and a phenotype -
                                                                                                                                                                                                         Human obesity-associated biallelic marker downstream PCR primer #57.

```
The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The MMS are polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to
                                                                                                                                                   Five sets of purine-rich methylphosphonate oligonucleosides ("MP oligomers") and complementary ribooligonucleosides ("RNA oligomers") were examined for their ability to form triple helix complexes. (Set 1:G2100 and R39; Set 2:G2101 and R289; Set 3:G2102 and R291; Set 4:G2104 and R293; Set 5:G2106 and R84 - see AAG68229-34 and AAQ80860-63).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kit for automated genotyping contg. pairs of PCR primers - designed to amplify polymorphic nucleotide repeat sequences, arranged in sets each with a characteristic fluorescence label, useful e.g. in detection of disease related genetic rearrangement
                                                                                                                                                                                                                                                                           It was shown that replacing two adenines with two thymidines is somewhat destabilising, and that replacing two guanines with two cytidines is more destabilising w.r.t. triple helix formation (Updated on 25-MAR-2003 to correct PN field.)
                                 Detection, recognition, inhibition and alteration of single and double stranded target nucleic acid sequences - by formation of striple helix structure using 2 oligomers which block translation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       primer; polymerase chain reaction; PCR; linkage study; locus;

(ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 11 primer pairs are shown in AAQ5881-82. The published size range of the D55425 allele is 224-248 bp, and the degree of heterozygosity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the following microsatellite markers on chromosome 1q21q31 associated with occurrence of juvenile glaucoma: afm350yhl; afm122xa3; nga1; afm218xb3; afm218ye5; afm218xb10; afm157xe7 and NGA5. An oligonucleotide primer of the present sequence was used with a primer having the sequence given in AAT43026 to amplify the afm350yhl marker. Apart from detecting predisposition to disease, the microsatellites should allow localisation, and thus isolation, of
 each polymorphism. When the MMS show considerable polymorphism
                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting pre-disposition to juvenile glaucoma - from presence of specific micro:satellite markers on chromosome 1q21q31, also DNA from the region defined by these markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Predisposition to juvenile glaucoma is detected by characterising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Microsatellite, genetic marker, screening, detection, PCR primer, polymerase chain reaction, juvenile glaucoma, predisposition, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a primer of the invention. The invention relates to sequences of at least two mucleotides of formula:

(X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)k-delta-N3'; where
X = a labelled compound and/or a nucleotide with voluntary sequence;
m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guamine or cytosine;
N = adenine, gamma = thymine;
k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.

The present invention relates to a method for selecting PCR primers for nucleic acid amplification. The method comprises determining the melting temperature (T m) range for degenerate oligonucleotide primers with a fixed-sequence portion (FS) and a degenerate sequence portion (DS) by searching known portion of a nucleic acid template for a sequence complementary to a desired FS of a primer. Nucleotide base pairs flanking or interspersed between the sequence complementary to a DS of one of the primers are detected and T m is calculated. The method of the present invention allows primers which produce more efficient DNA amplification to be produced. The present sequence is a primer used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes methods for genotyping polymorphisms that result in the gain or loss of an endonuclease site polymorphisms (ESPS). The method comprises deriving a set of concomitantly amplifiable target DNA fragments from sample DNA, treating the target DNA fragments with a
                                                        Determining Tm range for several degenerate primers with a fixed-sequence and a degenerate-sequence portion for use in polymerase chain reaction amplification by identifying a specific sequence in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel method for restricted amplicon analysis of endonuclease site polymorphisms resulting in loss of restriction sites, useful for multiplex genotyping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphism; endonuclease site polymorphism; ESP; genetic marker; restriction endonuclease; high throughput genetic analysis; animal breeding; plant breeding; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for selecting PCR primers for nucleic acid amplification. The method comprises determining the melting temperature (T_m) range for degenerate oligonucleotide primers with a fixed sequence portion (FS) and a degenerate-sequence portion (DS) by searching known portion of a nucleic acid template for a sequence complementary to a desired FS of a primer. Nucleotide base pairs flanking or interspersed between the sequence complementary to a DS of one of primers are detected and T m is calculated. The method of the present thouse primers which produce more efficient DNA amplification to be produced. The present sequence is a primer used in the method of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                Determining Tm range for several degenerate primers with a fixed-sequence and a degenerate-sequence portion for use in polymerase chain reaction amplification by identifying a specific sequence in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primer; nucleic acid amplification; melting temperature; T_m; 88.

probe restriction endonuclease reagent, amplifying the DNA fragments, and analysing the DNA to determine which target fragments have been, and have not been, amplified. Target DNA fragments which have been amplified lack a recognition site for the probe restriction endonuclease reagent, and target fragments having a recognition site for the probe restriction disagnosing the immense number of genetic markers that are needed to unravel complex traits. The method is capable of unravel complex traits. The method is useful for high throughput genetic identify genes involved in quantitative agronomic traits. The methods are also useful to monitor mutations in specific genes or loci in addition to scanning the entire genome. The present sequence represents a for a per primer used in the course of the invention, for genetic analysis

Isolation of nucleic acid ligands to hepatocyte growth factor, its receptor c-met and integrins, useful for treating tumors, deep vein thrombosis and diabetic retinopathy -

Example 1; Fig 2; 226pp; English

```
ò
present invention provides nucleic acid ligands to hepatocyte growth or/scatter factor (HGF), its receptor c-met and integrins. Integrins
                      factor/scatter factor (HGF), its receptor c-met and integrins. Integrins are involved in cell adhesion and migration, and HGF is a cytokine involved in cell proliferation and migration. The ligands of the invention are useful in the treatment of diseases such as cancer, thrombosis, hypertension, arteriosclerosis, myocardial infarction, rheumatoid arthritis, macular degeneration, endometriosis, psoriasis, stroke, osteoporosis and restenosis. The present sequence is an example

Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification

Example 22; Page 76; 152pp; Japanese.

The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligomuchecide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate the invention.

The method comprises determining the expression levels of the indicator genes in the biological sample from a patient, and comparing the expression level with that in the sample of a healthy individual. The method is useful for examining bronchial asthma, which is useful in assessing the risk of attacks with SCCA1 and SCCA2 gene expression levels as indication. The method is cheap and capable of operating in high throughput, even for bedside diagnosis. The present sequence represents a PCR primer used in the examples of the present invention.

```
This invention describes a novel method for the diagnostic detection and/or identification of Gram-positive bacteria that have a high G+C content, especially Mycobacteria. The method comprises subjecting a sample to nucleic acid amplification using the PCR primers represented in ABX94483-ABX94492. The amplification mixture, or part of it, is then tested for hybridisation to at least one of the probes represented in ABX94493-ABX94524 which can be immobilised on a solid phase or used in kit form. The specified primers/probes provide highly specific detection of particular Gram positive bacteria, which are difficult to differentiate by morphological or biochemical tests and/or those which take a long time to test because of their slow growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a preferred target sequence for an enzymatic nuclecide base position indicated in the DE line.

RNA at the nucleotide base position indicated in the DE line.

Regions of the mRNA that do not form secondary folding.

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin structures and that contain potential hammerhead and hairpin structures and that contain potential hammerhead and hairpin structures and that contain severe identified by computer analysis.

Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with renumatoid arthritis, asthma and other inflammatory disorders.

(Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (Preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
    smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty, and in cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk, hammerhead ribozyme; halripin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; coular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene expression or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human c-myb hammerhead ribozyme target sequence (nt. position 1276).
                                     The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nuclectide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with theumatoid arthritis, asthma and other inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New enzymatic nucleic acid molecules - which cleave RNA produced by e.g. c-myb, for treating restenosis or cancer
